About Daniel Research Group

Our Approach

The Daniel Research Group's EquilibriumSolver (EQS) is a forecasting tool that utilizes a combination of long-term market trends, current unit shipments and revenue data, and analyst assessments of influencing economic, demographic, and market factors. The purpose of the EQS is to generate forecasts that are highly predictive by incorporating both mathematical calculations and insights from external sources.

The **EQS** algorithm considers variables such as Total Available Market (TAM), Penetration, Density, and Replacement Rate trends. It takes into account actual reported year-to-date data on unit shipments and revenue. Additionally, it incorporates the insights and expertise of our analysts regarding the magnitude and direction of major causal factors influencing the market.

By leveraging this comprehensive set of inputs, the **EQS** algorithm calculates forecasts for key variables and metrics. The algorithm aims to converge on the most likely forecast for each variable based on the provided input data and parameters. The resulting forecasts are expected to be both mathematically consistent and aligned with the narrative developed from external data, information, and analysts' knowledge and insights.

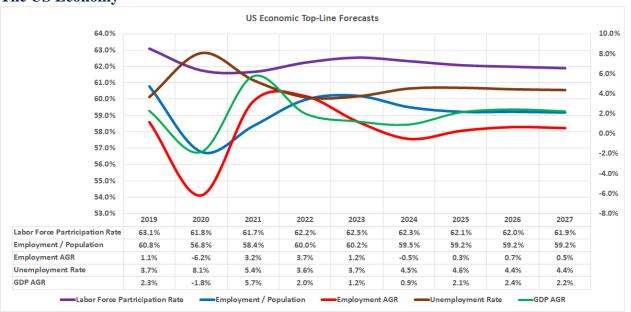

In summary, the core algorithm of the **Daniel Research Group's EquilibriumSolver** is designed to generate highly predictive forecasts by considering a wide range of factors and data, resulting in forecasts that are mathematically sound and consistent with the overall market narrative.

The Forecasting Challenge

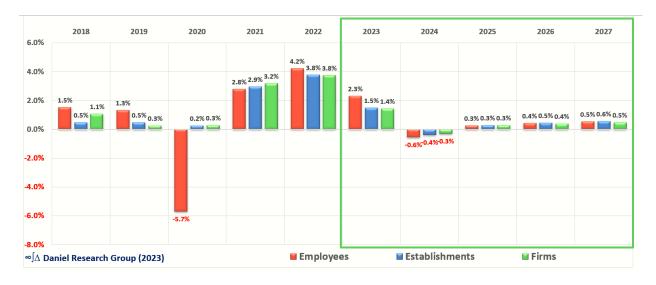

The major forecasting challenge over the past three years has been understanding the disruptive changes to household and business computing and communication personal device demand caused by the pandemic and the subsequent policies and procedures designed to mitigate its damaging effects. That period is now over and the new challenge is to **understand the rate at which demand behavior will return to pre-pandemic levels and trends.**

Major Influencing Factors and Assumptions

The US Economy

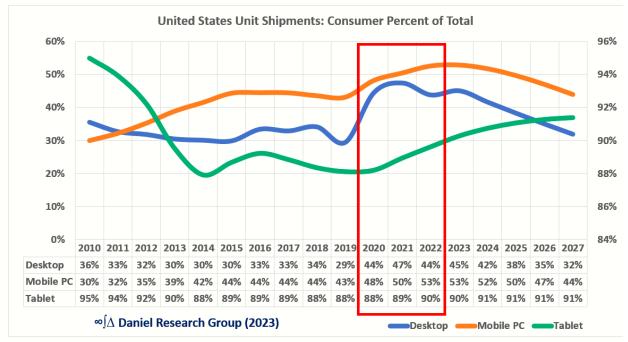

DRG's current United States economic analysis and model predicts a "soft landing" with no recession. However, we are predicting that the unemployment rate will increase over the forecast period over its current level. Our models also predict that total average employment in 2024 will slightly decline over 2023 levels before resuming slow growth in the subsequent years. This will also have an impact on the continuing decline in the number of businesses.

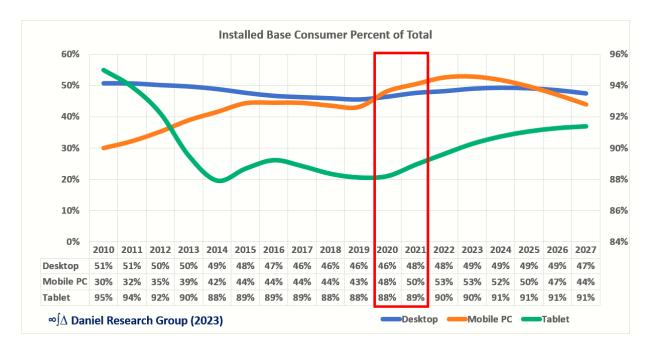

Segment Shifts

One of the most significant changes to the United States Personal Device market caused by the pandemic was the Segment shift from Enterprise to Consumer.

All three product categories saw the Consumer share of the market gain at the expense of the Enterprise share. The primary driver being the increase in demand to support Work From Home, Learn from Home, and Home Entertainment use cases during the pandemic. While we expect the Segment splits for Desktops vs Mobile PCs to begin to return to historic levels. Tablets will continue to slightly gain consumer share.

Starting in 2023 the Segment Splits will reverse and return to pre pandemic levels resulting in the Enterprise share of Units Shipments increasing for almost all devices.

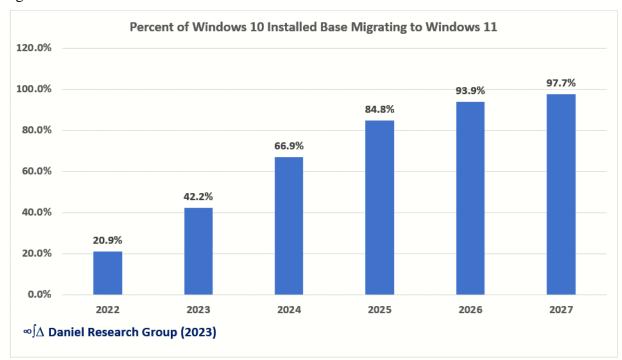

US Personal Device	es Unit Sh	ipments:	Enterprise %	of Total
	2022	2023	2027 Ch	ange ('22-'27)
Total Desktop PC	56.2%	54.9%	68.1%	11.9%

Replacement Rates

With both Penetration and Density following long-term stable trends, the primary demand driver will be Replacement Rates. A primary assumption of our forecast model is that Replacement Rates will slowly return to pre-pandemic trends and levels. In most cases, Replacement Rates will slow. While this will have a negative influence on Unit Shipments, it will increase Installed Bases.

Causal factors influencing an increase in replacement rates:

• The end of support for Windows 10 driving an increase in demand for new Desktops and Mobile PCs running Windows 11. However, only 40% of PCs running Windows 10 are estimated to not being able to support Windows 11 and therefore must be replaced. The following chart forecasts the Windows 10 to Windows 11 migration based on the migration rate to date.

- Return to Work requiring businesses to reprovision many of the returning employees.
- Replacement for Chromebooks that have a shorter mean time to failures than other Personal Computers. These were a significant proportion of the pandemic surge buying to support Learn from Home in the Consumer Segment.
- New product introductions that support new use cases or provide compelling new capabilities.

Causal factors influencing a **decrease in replacement rates**:

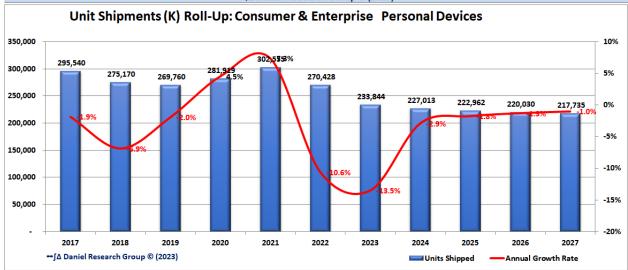

- Economic uncertainty about
 - o Inflation, Prices
 - o Credit, Interest Rates
 - o Employment
- The additional devices purchased during the pandemic that still support use cases are not ready for replacement yet. In addition, not all of these devices will be replaced as their pandemic based use case no longer exists.
- The continuing decrease in the number of businesses.
- Election Year: Negative economic forecasts as part of one of the political party's messaging will influence buyers to postpone spending.
- Return to pre-pandemic purchasing behaviors.

Our conclusion is that the influencing factors driving a slowing of replacement rates outweighs the influencing factors driving an increase in replacement rates. We expect Replacement Rates for most product/segment cases to slow over the forecast period resulting in the Replacement Cycle Lengths (RCLs) increasing.

Purpose and Location

Alternative Taxonomy – **DRG** has found it useful to aggregate the base models into a taxonomy based on **Location** (Fixed or Mobile), and **Primary Purpose** (Content Creation and/or Capture, Delivery, or Communication).

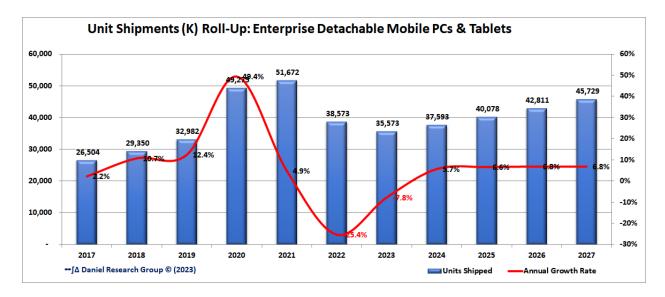

- Fixed Creation Desktop PCs
- Mobile Delivery Slate Tablets and e-Readers
- Mobile Creation & Capture Mobile PCs and Detachable Tablets
- Communication Mobile Phones

Mobile Content Capture and Creation Consumer

■Units Shipped —Annual Growth Rate

Market Model Variables

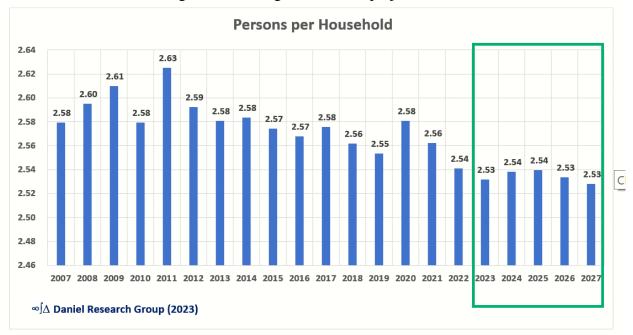

The market for almost any product or service can be defined in terms of six variables;

- 1. Total Available Market
- 2. Penetration
- 3. Density
- 4. Replacement Cycle Length
- 5. Unit Shipments
- 6. Installed Base

The **DRG** EquilibriumSolver (**EQS**) algorithm expresses these variables such that each of the six variables can be computed from the other five. The resulting model is **direction agnostic** facilitating the development of forecast scenarios that are consistent with historical trends while reflecting current and future exogenous market and economic events.

Total Available Market (TAM)

Consumer Households: The historic and forecast data was obtained from the United States Census Bureau and the Congressional Budget Office and projected to 2027.

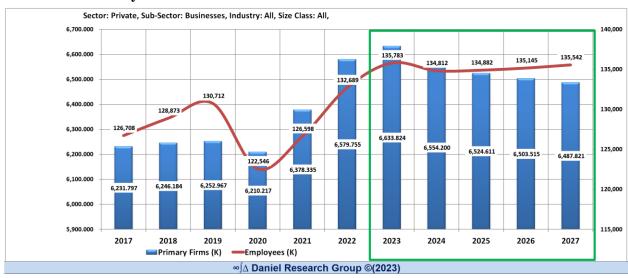

The long-term trend of slowly deceasing household size temporarily reverses during economic disruption as in 2011 and 2020. The small increases in 2024 and 2025 reflects the forecasted economic slowdown, the "soft landing"

Enterprise Businesses: DRG's Business Economic Demographic Database (BEDD) model forecasts that both employment and the number of active businesses will decrease in 2024. While employment will return to growth in the subsequent year, the number of active businesses will continue to decrease. The TAM used in the Enterprise Models is **Primary Firms** as computed in the **DRG BEDD** model that incorporates data from the US Census Bureau, Bureau of Labor Statistics, Bureau of Economic Analysis, The Congressional Budget Office, the Department of Defense, and other public and private sources.

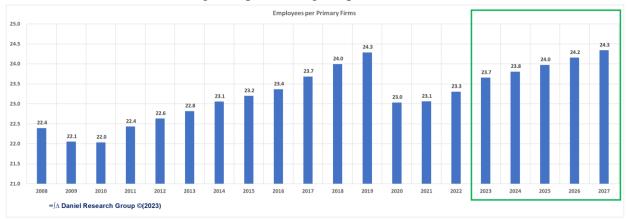

Total Public and Private Sectors

Private Sector Only

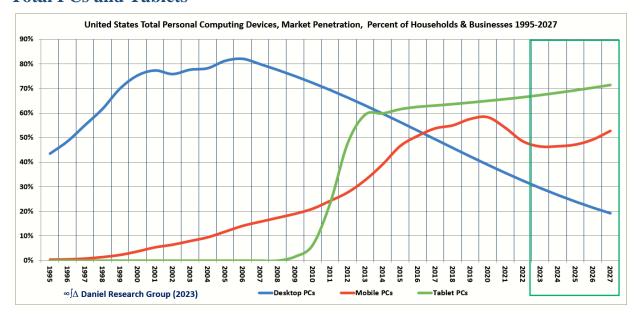

While the number of businesses is declining, the average number of employees per business will continue to increases after being disrupted during the pandemics.

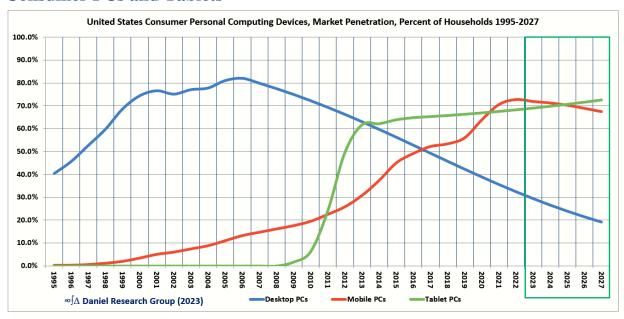

Penetration

Theoretically, penetration rates should follow the Diffusion of Innovation S-Shaped curve. However, in most cases there are deviations where the actual curve accelerates, flattens, or even declines from its expected path, sometimes even returning to the expected path later. There are several reasons for this such as an economic shock, or an incorrect assumption as to the size of the TAM. More often, the S-shaped penetration parameters change because of changes in user/buyer preferences due to new product introduction, upgrades, or emerging use-cases.

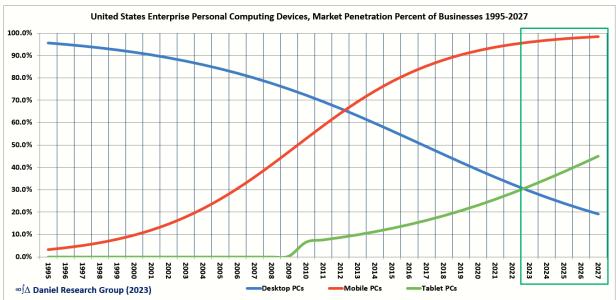

Total PCs and Tablets

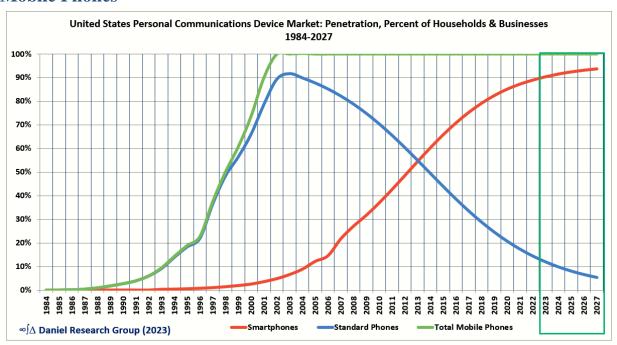

Consumer PCs and Tablets

Enterprise PCs and Tablets

Mobile Phones

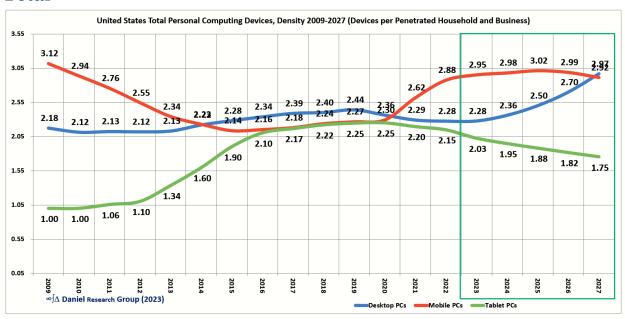

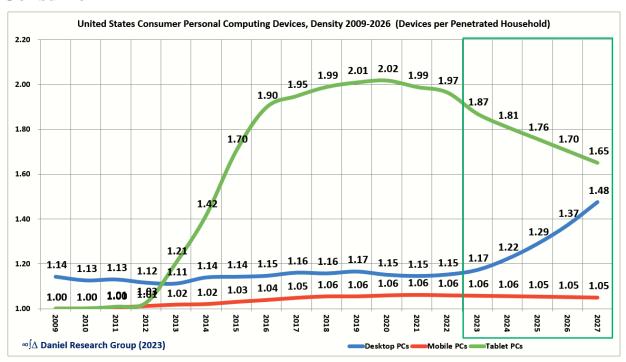

Density

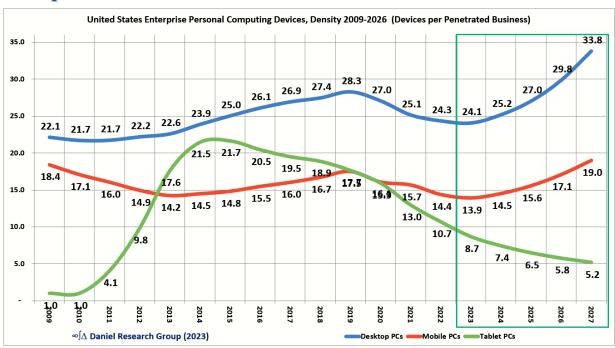

Density is the average number of Installed Base units in penetrated households and/or businesses. Densities are independent of penetration and reflect the distribution of single or multiple product users over the life of the product and the timing of the purchase of additional units. For most products, early adopters are more likely to be multiple unit buyers than later adopters. As the product enters the middle phase of its market life, the density will begin to decrease. For some products the density will start to increase again at the very end of the product life as the few remaining users are more likely to be multiple unit users than those who have stopped using the product.

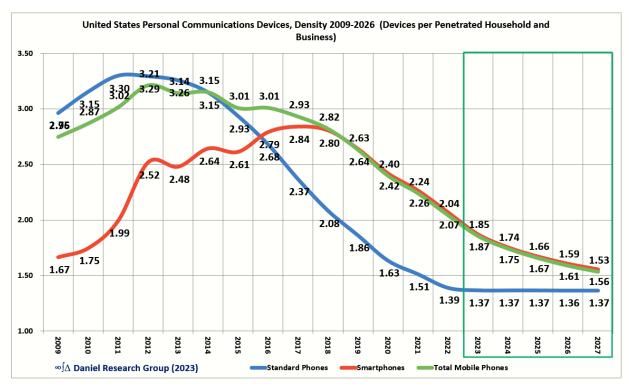

The significant increase densities for Mobile PCs reflects the excess buying in the Consumer Segments to support pandemic caused increase in Work From Home, Learn From Home and home entertainment use cases. The significant increase in desktop density in the Enterprise Segment in the forecast period is reflective of the need to provision employees shifting back to on-site workplace work or hybrid working arrangements, as well as an increase in use cases that require the power off desktops.

Total

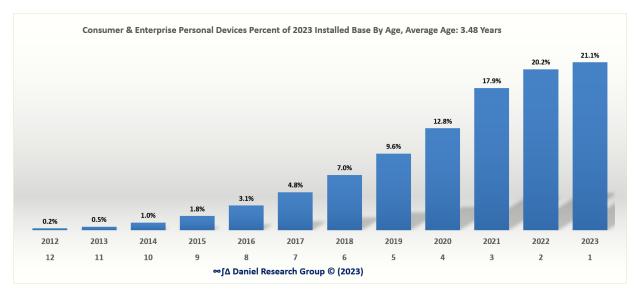

Replacement Rates

How long are current users expected to continue to use their current device until they replace them? That is one of the most important questions that device vendors and sellers need to ask, and is very difficult to answer. Asking current users when they expect to replace requires them to have knowledge of future product, economic and market conditions that they may not know. The **EQS** methodology and models utilize four different metrics to measure historical and forecasted length of time a device is in use before being removed from the Installed Base.

Retention Rate Distribution Mean (RRD- μ), Standard Deviation and Maximum Life. Given the number of Units Shipped in any year, the RRD- μ is the number of years from the current year when 50% of those Units will still be in the Installed Base. The distribution is assumed to be a left (1) and right (Maximum Life) truncated normal distribution with a specified standard deviation. The RRD parameters are usually inputs to the model and are based on our analysis of economic, market, and user behavior factors. However, the RRD- μ may be either an input or an output of the forecast model depending on the directional configuration. When constructing a model for the first time, the RRD parameters are solved for by EQS based on known historical Unit Shipments and Installed Base data. This provides the historical context for constructing and then validating RRD forecasts, as well as providing an historical baseline to validate the forecasts.

Average Installed Base Age (AIBA). The **EQS** models compute the age distribution of the Installed Base in every year. However, AIBA is often highly dependent on the relative magnitude of current Unit Shipments in relationship to the Installed Base, and is therefore may not be an accurate estimate of how long users will continue to use the device when either Unit Shipments or Removals exhibit high year to year variance.

The **EQS** Models compute and output the age distribution of the Installed Base for every historical and forecasted year. The demand for After Market/Reverse Logistics products and services are more a function of the Installed Base than the initial Unit Shipments.

Replacement Cycle Length (RCL)

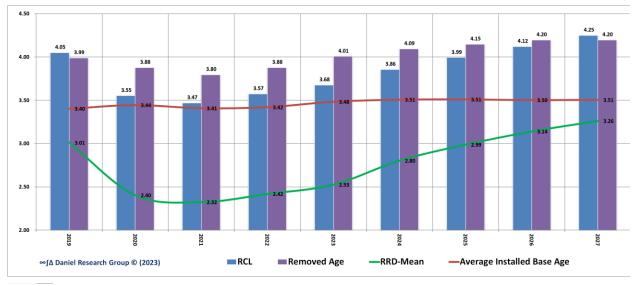

$$RCL = \frac{Starting\ Installed\ Base\ + Unit\ Shipments}{Units\ Exiting\ the\ Insalled\ Base}$$

RCL is the length of time it will take for all the existing units in the Installed Base to be replaced given the current Installed Base size, Unit Shipments, and number of Units Removed from the Installed Base in that year. The **EQS** algorithm allows the RRD- μ to be adjusted to produce a target RCL value. Therefore, the models may be configured to use RCL as either an input or an output variable.

Under normal conditions, RCL is the favored metric for predicting the length of use/ownership trends of Personal Devices. However, like the AIBA metric, its predictive properties diminish when the variance of the Unit Shipments or Removed Units exiting the Installed Base increases. In 2020 and 2021, RCL will show considerable variance in the Enterprise Segment due to the significant number of Units exiting the Installed Base as a result of business closures in 2020 and recovery buying in 2021. Moving forward from 2023, RCL will regain its strong predictive and explanatory properties.

Average Removal Age (ARA) – This is the average age of the units exiting the Installed Base for any reason. It is an estimate of the average age that would be computed if you could ask every user who stopped using the device how long they had used it before replacing or other reasons for use termination.

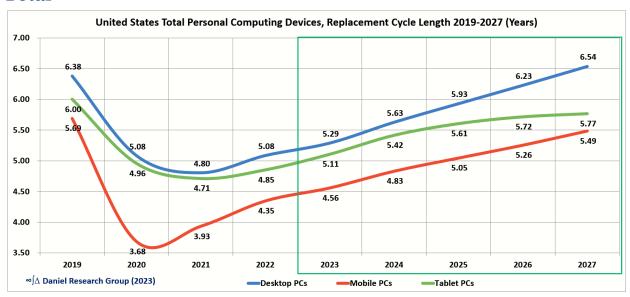

The value of each of these metrics is more in the trend than in the point values. A comparison of the four Installed Base age metrics for Total Computing Devices is presented in this chart. The RCL and RRD-Mean will exhibit the most variance due to anomalous events such as the operating system migration and economic shocks. Therefore, currently the Average Installed Base Age and the Average Removal Age are better estimates of future replacement rates.

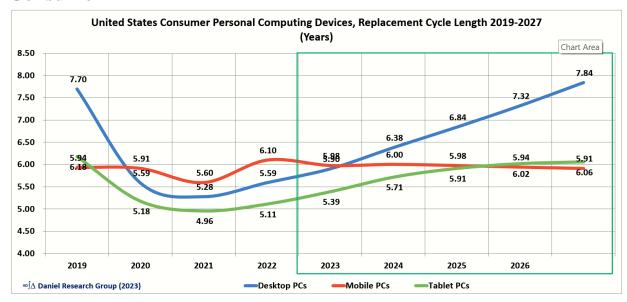

Each of the Age metrics answers a different question.

Metric	Question	
AIBA	How old are the units in the Installed Base?	
ARA	How old are the units people are just now no longer using.	
RRD-µ	How much time from now will 50% of this year's Unit Shipments still be in use?	
RCL	How long will it take to replace all the units in the Installed Base?

Methodology

Forecasting Approach and Process

In order to understand our forecast conclusions, a review of our forecast approach is necessary. Although forecasts of Unit Shipments and Revenues are of most interest to our clients, we consider these to be output results with very little predictive properties in and of themselves. Rather we base our forecasts on understanding the trends and the influences on those trends of the following primary causal variables.

- **Total Available Market (TAM)** The number of potential buyers in the Consumer and/or Enterprise Segments.
- **Penetration** The percent of buyers, households and/or businesses, that have, or will, purchase the product or service.
- **Density** the number of product or service units in use per penetrated household and/or business.
- Replacement Rate rate at which users are replacing older units with new ones. This is primarily measured in terms of the Replacement Cycle Length. The length of time it would take to replace all the current units in the Installed Base given the initial size of the Installed Base, the current year Unit Shipments, and the current year number of units removed from the Installed Base.

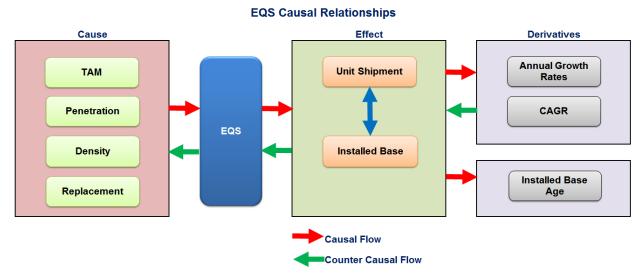

Our forecast approach proceeds in four modeling levels.

- 1. **Penetration** Top-Down Long-Term models that forecast future market penetration of the primary major products categories based on long-terms historical trends.
- 2. **Top-Down** The primary major products are split by segment (consumer and enterprise) and form factor, as needed.
- 3. **Base** Each individual product/segment/form factor forecasts are adjusted to reflect our analysis of the economic, demographic, technological, market and user behavior influencing factors.

4. **Aggregation** – The base forecasts are rolled-up to higher levels. While some of the output metrics such as Unit Shipments, Revenues and Installed Bases are additive, other such as Density, Penetration, Replacement Cycle Length, and Installed Base Age can only be computed using **DRG**'s proprietary **EQS** methodology. In most models, the Base models are adjusted through a calibration step such that the roll-up matches the Top-Down for a specified metric.

Models are neat, but markets are messy. Any market model is at best an idealized simplistic version of a complex real world process. How useful any model can be is a function of how well it encapsulates the basic infuencing relationships that drive cause and effect. When EQS models a Causal Flow, the four inputs compute the primary outputs: Unit Shipments and Insalled Base, as well as the derivative metrics Annual Growth Rates, CAGRs, and the Installed Base Average Age. For example, an increase in the penetration rate will result in an increase in Unit Shipments and/or an increase in the Installed Base, as well as changing the derivative metrics.

When **EQS** models a **Counter Causal Flow**, the logic flows in the other direction. An increase in the Unit Shipments will require an increase in one or more of the Causal variables, as well as changing the derivative metrics.

The strength of **EQS** as a market modeling and forecasting tool derives from two attributes;

- 1. The ability to run both Causal and Counter Causal logic.
- 2. A closed system of relationships that can only produce outputs that meet real world constraints and criteria set by the user.

Supporting Models

The **DRG Business Demographic Baseline and Forecast (BEDD)** is a database of United States Firms, Primary Firms, Establishments, and Payrolls by Private and Public Sectors, by 2-Digit NAICS industries, from 1998 to 2027. It is derived from data obtained from the US Census Bureau, the Bureau of Economic Analysis, the Bureau of Labor Statistics, the Department of Defense, and the Congressional Budget Office.

Forecast Updates

DRG will update its forecasts periodically as actual year-to-date results become available. Utilizing the **DRG ProjectionSolver and GrowthSolver** algorithms, new current year projections based on historic trended quarterly or monthly patterns are computed. Based on these projections, adjustments may be made to the primary **EQS** models.

Sources of Historical Data

Historical data was obtained from the following available sources including press releases, published reports and presentations, and publicly available databases.

Device or Metric	Unit Shipments	Installed Base/Penetration
Desktop PCs	Environmental Protection Agency	Computer Almanac
		eTForecaster
	IDC	International Telecommunications Union
		Worldbank
Mobile PCs	Environmental Protection Agency	Computer Almanac
		eTForecaster
	IDC	International Telecommunications Union
		Worldbank
Tablets	IDC	Pew Research Center
Mobile	Consumer Technology	Cellular Telephone Industries Association
Phones	Association	Centers for Disease Control and
		Prevention
	Telecommunications Industry	GSMA
	Association	International Telecommunications Union
		Organization for Economic Co-operation
	IDC	and Development
		Telecommunications Industry Association
		Worldbank
Households	US Census Bureau	
	Congressional Budget Office	
Businesses	Bureau of Economic Analysis	
	Bureau of Labor Statistics	
	Congressional Budget Office	
	Department of Defense	
	US Census Bureau	
	US Office of Personal	
	Management	

Data obtained from a variety of sources, often using different definitions and methodologies are frequently inconsistent with each other. **DRG** employs **EQS** to identify and correct these differences and produce historic time-series of Unit Shipments, Installed Bases, Replacement Rates, Average Ages, Densities and Penetration Rates that are internally consistent with each other, and correlate highly with external quantitative data and qualitative data criteria. **DRG** believes the resulting historical baseline is the most accurate complete accounting of the US Personal Device Market from its inception in 1975.

About Daniel Research Group

Daniel Research Group is a market research and consulting firm servicing primarily technology clients. Our primary focus is developing custom market models and forecasts. We support clients three ways.

- 1. We work independently or collaboratively with the client's own analysts to **produce custom** technology product/service **market models and forecasts.**
- 2. We work collaboratively with the client's own analysts to **design and develop the modeling applications** that they will use to develop their own market models and forecasts.
- 3. We **train client's analysts** in the theory and practice of technology market modeling and forecasting.

Most of our work utilizes the inventory of proprietary methodologies and algorithms that we have developed over more than 35 years. We have built technology forecasting market models for many major technology vendors, market research firms, and industry organizations. While our core competency is forecasting, our subject experience covers the entire technology and technology-enabled product/service landscape. We also support our engagements with traditional qualitative and quantitative research, as well as tactical and strategic consulting services.

Stephen J. Daniel - President

With over four decades in the Information Technology Industry, Mr. Daniel has developed a unique blend of Market and Technology experience coupled with a deep understanding of Market Research Methodology. His primary strength is in understanding the decision-making context within which the results of his research will be applied. This is manifested by his ability to design and execute studies that precisely meet client objectives in a timely fashion and at reasonable costs.

Mr. Daniel received his BS in Finance from Northeastern University and earned an MBA in Quantitative Analysis from New York University. He is a member of the American Statistical Association, American Economic Association, The Market Research Association of America, the American Marketing Association, National Association for Business Economics, and the Qualitative Research Association of America.
